Professional Summary

Here are a few options, choose the one that best fits your preference:

****Option 1 (Concise & Direct):****

Highly motivated B.Tech graduate with practical experience in AI/ML projects like chatbot development and deep fake detection. Proficient in Python and actively developing skills in AWS Cloud Computing. Eager to leverage strong technical foundations and problem-solving abilities to contribute to innovative tech solutions.

****Option 2 (Emphasizing Learning):****

Results-driven B.Tech fresher eager to apply knowledge gained from projects in chatbot and deep fake detection. Building proficiency in Python and actively acquiring AWS Cloud Computing skills. Seeking an entry-level role to contribute innovative solutions and drive technological advancement.

****Option 3 (Action-Oriented):****

B.Tech graduate with hands-on project experience in AI/ML, including chatbot development and deep fake detection. Skilled in Python and actively expanding expertise in AWS Cloud Computing. Committed to applying strong analytical and problem-solving capabilities to a challenging tech environment.

Education

btech

Projects

chatbot, deep fake detection

Experience

fresher

Certifications

npTEL, cloud computing

Technical Skills

learning python, and aws cloud computing

ATS Report

Okay, let's put on the ATS hat and evaluate this profile.

ATS Resume Checker Report

Candidate Profile:

- * ****Skills:**** learning python, and aws cloud computing
- * ****Projects:**** chatbot, deep fake detection
- * ****Experience:**** fresher

****ATS Score: 55/100****

Explanation: The score reflects a mix of strong relevant keywords (Python, AWS, Chatbot, Deep Learning/AI via projects) but significant deductions due to the "learning" qualifier and the lack of specific details or quantifiable achievements typical of a fresher's resume.

Strengths

1. ****High-Demand Keywords:**** "Python" and "AWS cloud computing" are critical and frequently searched keywords in the tech industry, especially for roles in development, data science, and cloud engineering.
2. ****Relevant Project Domains:**** "Chatbot" and "Deep Fake Detection" are highly relevant to modern AI/ML, NLP, and Computer Vision fields. These projects imply practical application of Python and potentially cloud resources.
3. ****Initiative & Practical Application:**** Having projects, especially for a fresher, demonstrates initiative, self-learning, and the ability to apply theoretical knowledge to build practical solutions. This is a huge plus for human recruiters, and ATS will recognize the project keywords.

Weaknesses

1. ****"Learning" Qualifier is an ATS Blocker:**** The biggest weakness is explicitly stating "learning python" and "learning aws cloud computing." ATS systems primarily look for **proficiency** and **experience** with skills, not the process of acquiring them. This phrase will significantly reduce your match score against job descriptions asking for "Proficient in Python" or "Experience with AWS."
2. ****Lack of Specificity in Skills:**** "AWS cloud computing" is very broad. ATS benefits from specific service names (e.g., AWS EC2, S3, Lambda, SageMaker, DynamoDB). Without this, your profile won't match roles requiring specific AWS services.
3. ****Missing Project Details:**** While the project **names** are good, ATS looks for what technologies were **used** within those projects (e.g., "Python, NLTK, TensorFlow for Chatbot," or "Python, OpenCV, PyTorch for Deep Fake Detection"). It also looks for the **impact** or **achievements** within the project (e.g., "Achieved 90% accuracy," "Reduced processing time by X%").
4. ****No Quantifiable Achievements:**** As a fresher, you won't have professional work experience, but ATS still looks for metrics. Your projects are the place to showcase this.
5. ****Limited Keyword Density/Diversity:**** While core keywords are present, expanding them to include specific libraries, frameworks, tools, and methodologies used (e.g., Git, Docker, Agile, Machine Learning, Deep Learning, NLP, Computer Vision) would boost your score.

Suggestions

1. **Remove "Learning" Qualifier from Skills Section:** This is the most crucial change. Instead, list skills directly:

- * **Current:** "learning python," "learning aws cloud computing"

- * **Improved:** "Python," "AWS Cloud Services" (and then elaborate)

- * **Self-correction:** If you genuinely feel you're only *just* learning, be strategic. For a resume, confidence is key. If you've *used* Python or AWS in your projects, you have "experience" with them.

2. **Elaborate on AWS Skills:** Break down "AWS Cloud Services" into specific services you've *used* or are *familiar with* in your learning or projects.

- * **Example:** "AWS (EC2, S3, Lambda, IAM, CloudFormation)" or "Familiar with AWS EC2, S3, and Lambda functions."

3. **Detail Your Projects with Keywords and Metrics:** For each project, create bullet points that include:

- * **Problem/Goal:** What was the project trying to achieve?

- * **Technologies Used:** List specific Python libraries, frameworks, tools, and AWS services.

- * **Your Role/Contribution:** What did *you* do?

- * **Results/Impact:** Quantify achievements. Even for personal projects, you can estimate or measure (e.g., "Achieved 85% accuracy in sentiment analysis," "Developed a model with a F1-score of 0.88 for deep fake detection," "Processed X amount of data," "Deployed on AWS Lambda").

- * **Example for Chatbot:**

- * "Developed an AI Chatbot using Python, NLTK, and scikit-learn for [specific purpose e.g., customer service simulation]."

- * "Implemented natural language processing techniques including tokenization and intent recognition, achieving 90% accuracy on test dialogues."

- * "Deployed a prototype using Flask and Docker."

- * **Example for Deep Fake Detection:**
 - * "Built a Deep Fake Detection system leveraging Python, OpenCV, and TensorFlow/PyTorch for image/video analysis."
 - * "Utilized convolutional neural networks (CNNs) to identify subtle anomalies, resulting in a precision of 0.85 on benchmark datasets."
 - * "Explored data augmentation techniques to improve model generalization."
- 4. **Expand Your Technical Skills List:** Include any other tools, databases, operating systems, or methodologies you've encountered:
 - * **Programming Languages:** (Python)
 - * **Cloud Platforms:** (AWS - with specifics)
 - * **ML/DL Frameworks:** TensorFlow, PyTorch, scikit-learn
 - * **Libraries:** NumPy, Pandas, Matplotlib, NLTK, SpaCy, OpenCV
 - * **Databases:** SQL, MongoDB (if any exposure)
 - * **Tools:** Git, Docker, Jupyter Notebooks
 - * **Concepts:** Machine Learning, Deep Learning, Natural Language Processing (NLP), Computer Vision, Data Analysis, Data Structures & Algorithms.
- 5. **Create a Strong GitHub Portfolio:** For a fresher, a well-organized GitHub with clean code and clear READMEs for your projects is critical. Link this prominently on your resume. ATS doesn't "read" GitHub, but human recruiters will check it, and it verifies your skills.
- 6. **Consider Certifications:** If serious about AWS, an AWS Cloud Practitioner or Associate-level certification would significantly boost your ATS score for AWS-related roles and validate your cloud computing skills.

By implementing these suggestions, you can significantly improve your ATS score and make your resume much more appealing to both automated systems and human recruiters.
